

DT-1400

DESICCANT DRYING TABLET

Free water and vapor is a common impurity found in natural gas. Natural gas pipeline moisture specifications can be difficult to meet. Desiccants can lower relative humidity to an acceptable level, although common desiccants often do not take out enough water to meet more stringent specifications. **DT-1400** is three times more effective than the more common desiccants. **DT-1400** effectively lowers relative humidity to meet gas pipeline specifications.

DT-1400 can be used alone or in combination with **DT-1500**. In this application the gas flows through the **DT-1500** tower first removing most of the moisture and then through the **DT-1500** to meet pipeline specifications. This arrangement is more cost efficient because the QC-1400 lasts much longer in the vessel.

HARDER, MORE
